

Abstract for MA Machine

This is a new chip design for a modern day needs we all know that processors and every digital electronics is done by transistors a invention which have revolutionize the age of electronics. And seeing this I have created a new chip design which will divide our traditional 0s and 1s and use every electron (current) to it's fullest while transistors today use 0 and 1, 5V and 0V respectively. This new MA Machine will use MA codes and I have mentioned architecture, block diagrams and algorithm everything we need to design the chip and transistor this new innovation might help us unlock longer charging on the device, faster calculations and much more. I have mentioned the mathematical as well as algorithmic formulas to help experimental scientists to put into test.
